

**Response to Nevada Division of Environmental Protection (NDEP) Comments dated December 22, 2008, regarding BRC's December 9, 2008 Response to NDEP Comments dated November 4, 2008, regarding NDEP Request for Vertical Delineation of Contaminant Plumes and Hydraulic Gradients, NDEP Facility ID# H-000688**

1. Response-to-comment (RTC) 3.a, the NDEP has the following comments:
  - a. Please note that the 50 foot limitation was based on the fact that the majority of reported vertical gradients are quite small. Thus, when a well used in these calculations is on the order of 1,000 feet away the horizontal component of the gradient likely affects the calculation. This has been further supported by pumping tests completed by Tronox and the Pioneer-Olin-Stauffer-Syngenta-Montrose (POSSM) group. These pumping tests generally showed negligible response even at the 50 foot distance.

**Response:** BRC appreciates the clarification of this criterion. BRC notes, however, that the response to pumping can be limited by other factors such as: a short test duration, relatively low pumping rate, and other factors unrelated to vertical gradient calculations.

- b. BRC should be aware that layer two of the model only extends 50 feet below the base of model layer one. The vertical gradient evaluation extends beyond the scope of the groundwater flow model. The existing groundwater flow model is not an appropriate tool to address this question.

**Response:** NDEP is correct that model layer two represents approximately the top 50 feet of the UMCf. However, the effects of leakage between the upper portion of the UMCf and the deep UMCf is approximated through application of a general head boundary at the bottom of the model. The prescribed boundary heads for the general head boundary term are based on the available deep UMCf water level observations. Therefore, BRC believes that the groundwater flow model is a useful tool to assist with conceptualization of the potential distribution and relative magnitude of leakage between the shallow and deep UMCf.

- c. NDEP disagrees with BRC that additional wells are not necessary. NDEP believes that it is appropriate and timely to initiate installation of wells in deeper water-bearing zones (the "middle" and the "deep"). Regardless of the outputs of the groundwater flow model, these wells can be used as sentinel wells. NDEP requests that BRC provide a scope of work with the response to these comments. This scope of work should, at a minimum, propose wells along the northeast transect and along the northern side of the Lower Ponds.

**Response:** BRC will discuss data gaps with NDEP at the February 4th meeting, including suggested additional wells, so that these data gaps are comprehensively addressed as part of the conceptual site model (CSM) update.

- d. Please provide a revised figure based upon the revisions discussed in BRC's response.

Response: Figure 19 from the November 4, 2008 model calibration report is attached for review.

2. RTC 3.b, please note also NDEP's response to Comment 3.a above. One of the objectives for the vertical gradient assessment was to evaluate contaminants at depth and possible driving mechanisms. This is beyond the scope of BRC's existing groundwater flow model.

Response: Please see response to comment 1b above. BRC disagrees with NDEP's characterization of the scope of the modeling effort.

3. RTC 4.a, the NDEP has the following comments:
  - a. Please refer to NDEP's response to RTC 3.a above.

Response: As mentioned above in the response to comment 1c, BRC will discuss data gaps with NDEP at the February 4th meeting, including suggested additional wells, so that these data gaps are comprehensively addressed as part of the conceptual site model (CSM) update.

- b. This statement carries with it the problem of defining impacts to groundwater at the CAMU due to upgradient conditions. The NDEP disagrees that it is appropriate at this time to conclude that impacts to groundwater from the BMI Landfills are unknowable.

Response: BRC is currently conducting a baseline quarterly monitoring program for groundwater at the CAMU. Data from this effort, along with data collected by others in the CAMU area will be used to determine the impacts of BRC's CAMU area sources on groundwater, if any. As NDEP is aware, BRC has implemented source removal as a fundamental strategy to the maximum extent possible and practical, at the CAMU area. BRC maintains that, given the concentrations of pollutants upgradient, the impacts of the BMI Landfills to groundwater, are, in many cases, not knowable.

4. RTC 5, this answer is non-responsive. If BRC is correct about the elevated groundwater temperature in this area (per BRC's RTC 2); then, the 13.5 degree number that BRC apparently used for the calculations cannot be supported. Please advise.

Response: BRC utilized 15 degrees C as the input for temperature in the calculations. This value was obtained from the guidance (Ground Water, Vol 5 Page 669, Table 1). However, the attached table shows revised calculations using actual BRC well temperature data where available. None of the vertical gradients changed (from up to down or the reverse) as a result of the revised calculations using actual temperature data.

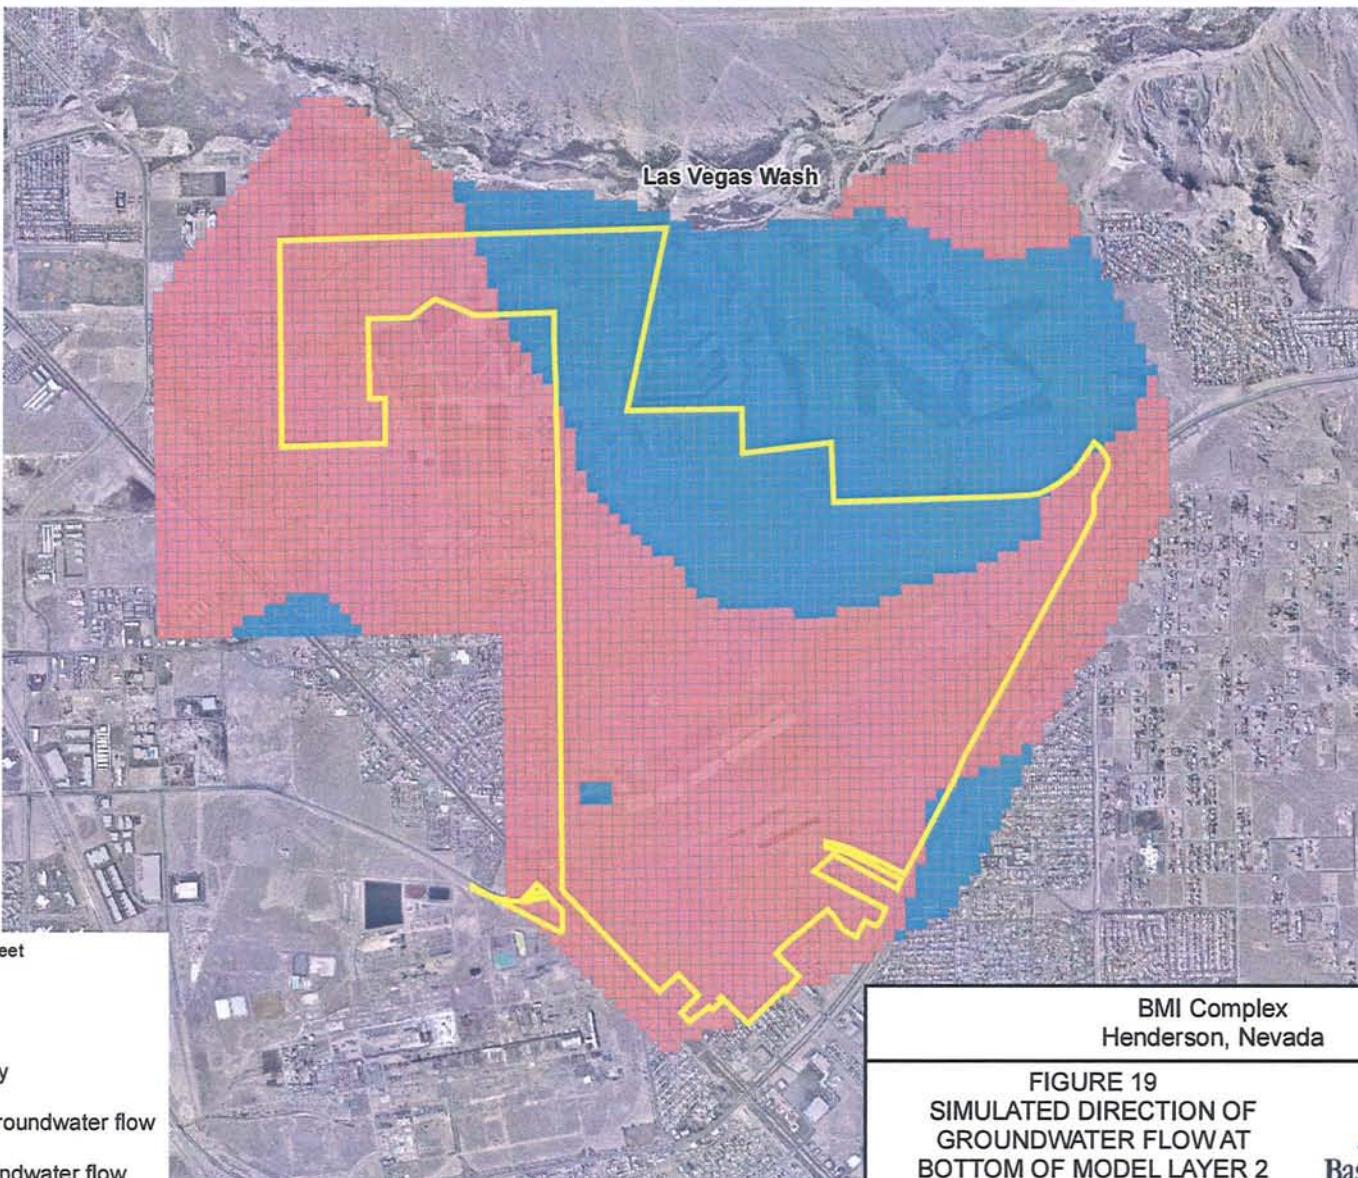

5. RTC 6.b, BRC's RTC 6, Part 1, is not applicable. The point here is that the anion sum indicated that for these samples the Standard Methods calculation is potentially not appropriate.

Response: Understood and agreed. BRC appreciates the clarification of this NDEP comment.

Mr. Mark Paris
